

# Collectors

## Background

Opmantek has had requests for distributed information gathering and see's the opportunity to increase functionality with a new product offering.

The *collector* is essentially a full install of Open-AudIT in 'collector' mode. This mode would reduce visible functionality in an effort to simplify and focus the application. It is designed to collect information about it's local networks and devices, where firewall and/or network traversal is an issue from the *server*

## Detailed information

Further details on this can be found at:
