

opCharts Collection Definition

Collection definitions apply a polling definition to a node.

They specify the:

- SNMP index to use (if required).
- The frequency to poll
- The amount of data to keep
- How long to collect for.

Collection definitions can be created/edited/deleted in the GUI and also from the CLI using:

```
opcharts-cli.pl
```

Importing and exporting of collection definitions is also supported using opcharts-cli.pl.

Note that these include node names so transferring these between servers means the node needs to exist on both servers.
