

Open-Audit 3.1.0 released

After some extensive code rework, Open-Audit 3.1.0 has been released for both Linux and Windows.

The [Release Notes for Open-Audit v3.1.0](#) provide specific details, but at a high level we've been changing the codebase to allow us to provide Open-Audit Cloud in the near future. A hosted version of Open-Audit that is always up to date, gets the latest code before regular releases, gets patches and bug fixes straight away and minimises the amount of infrastructure on premise required to get Open-Audit up and running.

There have also been improvements around [The Default Network Address](#), example device data, audit subsection processing, logging improvements, bug fixes and more.

I hope you find Open-Audit as useful as I do.

Mark Unwin.
