

Regular System Maintenance for NMIS

Like any system some regular maintenance will keep NMIS running smoothly, we have automated as much as we can and will continue to do so, here are a few things to check on.

- [Check and Audit the configuration](#)
- [Check the NMIS code base for syntax and dependencies.](#)
- [Ensure that DNS or host name changes reach the relevant parties](#)
- [Log rotation is the most important factor](#)
- [Cleaning up old RRD files periodically](#)
- [Other things](#)

Check and Audit the configuration

These commands tell you what folders and permissions are incorrect, and then just fix it.

```
/usr/local/nmis8/bin/nmis.pl type=audit
/usr/local/nmis8/bin/nmis.pl type=config
```

Check the NMIS code base for syntax and dependencies.

```
/usr/local/nmis8/admin/check_nmis_code.pl
```

Ensure that DNS or host name changes reach the relevant parties

As NMIS mostly runs periodically, out of cron, changes to your infrastructure outside of NMIS are usually picked up automatically. There is, however, one exception: `fpingd.pl` runs persistently and permanently (to minimize reaction time). NMIS starts `fpingd.pl` if there is none running and then leaves it to its own devices.

As a consequence, if you make changes to your DNS infrastructure or rename hosts, then it's necessary to notify `fpingd.pl` of those changes: simply run `/usr/local/nmis8/bin/fpingd.pl restart=true` after you've made your changes.

Please note that `fpingd.pl` caches information heavily, so restarting it very frequently is counterproductive.

Log rotation is the most important factor

Verify `logrotate.conf` is running in cron and setup for your files.

Cleaning up old RRD files periodically

```
cd /usr/local/nmis8/database
find . -name "*rrd" -type f -mtime +30 -print -exec rm {} \;
find . -name "*rrd" -type f -size 0 -print -exec rm {} \;
```

We have added a script to help with this, you can run it from admin folder, it will clean up files in there which are more than 30 days old, e.g.

```
/usr/local/nmis8/admin/nmis_file_cleanup.sh /usr/local/nmis8 30
```

Other things

Check the runtime graphs
Check for zombie processes
